

# Asia Pacific Economy to Slowdown in 2007

## State of the Region Report

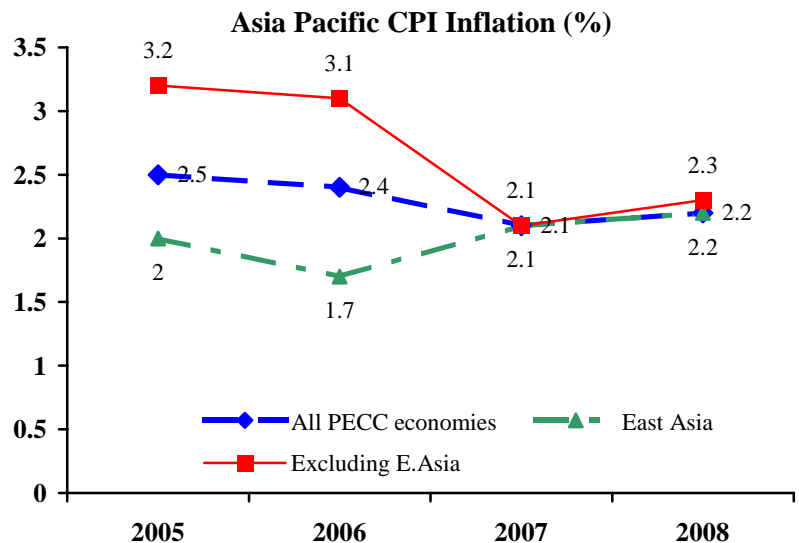

### 1<sup>st</sup> Quarter Economic Update

*East Asia set to continue leading region's economic growth*

Despite a widely anticipated slowdown in the United States, **real GDP growth** in the Asia Pacific region as a whole is expected to be a respectable 4.3% in 2007, compared to 5.0% the year before. East Asian economies will lead the region with 5.7% growth, down from 6.3% in 2006.

The current forecast is based on March 2007 inputs from PECC's panel of experts from 19 economies, and is unchanged from the 2006 year end update. A modest rebound is expected in 2008, with growth for the region as a whole at 4.5%, led again by East Asian economies.

*Inflation muted across Asia Pacific*

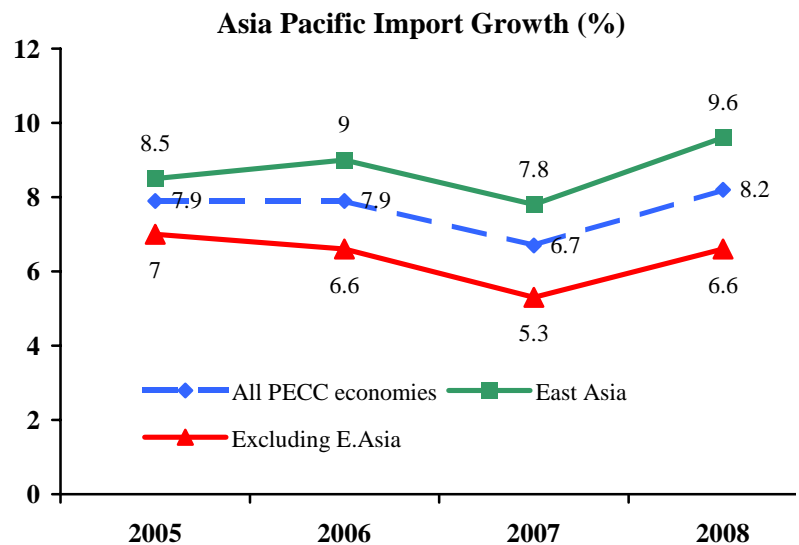

**Inflation** (measured by the consumer price index) remains muted at 2.1% for 2007, down from 2.4% in 2006, as cost pressures from higher energy prices in 2005-06 taper off. CPI inflation in 2008 will be essentially unchanged at 2.2%. Significant risks in the forecast include a sharp rise in energy and other commodity prices, protectionist pressures in the US, volatility in currency markets, and a health pandemic, such as bird flu.

*Trade set to decline in line with slower overall economic growth*

**Real export growth** is expected to decline from the more than 10% experienced in 2006 to 8.2% in 2007. The slowdown in export growth will be sharpest in East Asia, which is expected to see a decline from 12.6% in 2006 to 9.2% in 2007, due to the much anticipated slowdown in the United States.

**Real import growth** will also decline, from 7.9% in 2006 to an anticipated 6.7% in 2007. In line with an expected rebound in economic growth, both export and import growth are expected to pick up in 2008.

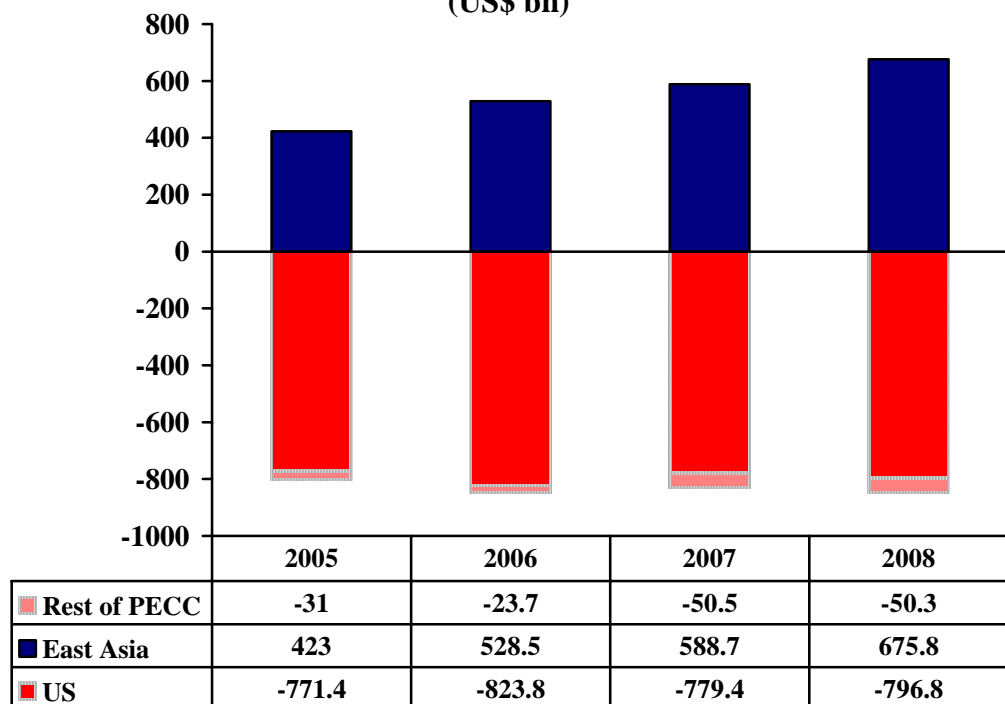

*China to continue to drive Asian economic growth*

**China** continues to drive Asian growth, with expansion in real GDP expected to top 10% through 2008. Despite perennial fears of overheating, CPI inflation is forecast to remain under control at 2.0% in 2007 and 2.5% in 2008. China's economy will be powered again by fixed asset investment, but the contribution of personal consumption to overall GDP growth is expected to be increasingly important as disposable incomes of Chinese households continue to rise. Concerns remain over excessive liquidity that is in part to blame for the sharp rise in domestic equity prices (and subsequent correction in the Shanghai Stock Exchange in February 2007).

*RMB will reach US\$1:RMB7.3 in 2008*

On the external front, China's current account surplus will continue to rise, to US\$315 billion in 2007 and US\$364 billion in 2008. Even though real import growth will exceed real export growth in 2008, the current large gap between the value of exports and the value of imports will mean a continued widening of the current account surplus. At around 10% of GDP, the surplus will be a lightning rod for protectionist sentiment in the United States, which appears to be gaining political momentum. Even though the Renminbi is expected to appreciate relative to the US dollar, from RMB8.0 in 2006 to RMB7.3 in 2008, this gradual rise in the Chinese currency may not be enough to satisfy trade hawks in Washington D.C.

**Asia Pacific Current Account Balances**  
(US\$ bn)

**Japan's** real GDP growth in 2006 was a robust 2.2%, marking eight consecutive quarters of economic expansion. Economic growth in the fourth quarter of 2006 was especially strong at an annualized rate of 5.5%, but there are signs that the economy has now entered a down phase in the business cycle. The Japanese economy is expected to slow to around 1.9% real GDP growth in 2007 before rebounding to 2.5% in 2008. The slowdown in 2007 will be due mostly to weaker production, reduced private demand, and an increasing fiscal burden. CPI Inflation is expected to rise by 0.6% in 2007 and 2008 and the GDP deflator will return to positive territory this year, likely marking the end of a long deflationary period in the

Japanese economy. Although there are concerns that the Bank of Japan's surprise hike in interest rates would scuttle the recovery, financial and property markets have been buoyant.

*U.S. current account deficit on a declining trend*

Real economic growth in the **United States** will be sharply lower in 2007 compared to 2006, but the current outlook is less pessimistic than at the end of last year. After two years of above 3 percent real GDP growth, the US economy will expand by around 2.4% in 2007, and 2.9% in 2008. The brisk increase in CPI Inflation in 2006, at 3.2%, is expected to fall sharply to 1.7% in 2007 due to lower oil prices. Growth in 2007 and 2008 will be led by personal consumption. Gross private fixed investment, on the other hand, will contract in 2007 and remain sluggish in 2008. In particular, residential construction is expected to fall by as much as 13% in 2007, following a decline of 4.2% in 2006. The recent plunge in the sub-prime lending market is not likely to result in financial sector distress, but it could lead to higher borrowing costs for prime rate borrowers, which will further delay the recovery in the US housing market.

*Decline in oil imports to draw attention to Asia surplus economies*

The external sector will continue to be a drag, or at best have a neutral effect, on the US economy. The current account deficit hit a record high of US\$824 billion in 2006, or 6.2% of GDP. The dollar value of the deficit is forecast to decline in 2007 before rising again slightly in 2008, but as a share of GDP, the US current deficit appears to be on a declining trend. Even so, American indebtedness to the rest of the world will be very high for many years to come, and the prospect of disorderly adjustment (through currency markets or protectionism) remains a serious risk to the world economy. Furthermore, with the sharp decline in oil prices since 2006, OPEC members will account for a reduced share of the counterpart surpluses, drawing further attention to East Asian surplus countries, notably China. It is likely, therefore, that the global imbalance problem will increasingly be seen as a trans-Pacific imbalance, which will pose special challenges for the management of economic and political-security relations among the major powers of the Pacific.
